

zees v.6

Constant Vector Fields

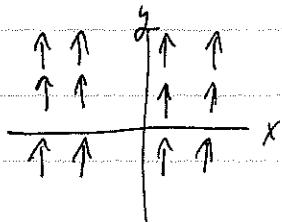

Consider flat space, with Cartesian coordinates ξ^α ,

$$ds^2 = d\xi^\alpha d\xi^\beta \delta_{\alpha\beta} \quad \text{in ordinary space, or}$$

$$ds^2 = d\xi^\alpha d\xi^\beta \eta_{\alpha\beta} \quad \text{in spacetime.}$$

A constant vector field is one in which $\frac{\partial V^\mu}{\partial \xi^\alpha} = 0$.

(Note that in non-Cartesian coordinates this is not true
 $\frac{\partial V^\mu}{\partial x^\nu} \neq 0$ in general.)

$$V^x = 0, V^y = 1 \quad \text{constant, but}$$
$$V^r = \sin\theta, V^\theta = \frac{\cos\theta}{r} \quad \text{polar coords.}$$

In curved space (time), a constant vector field satisfies $\frac{\partial V^\mu}{\partial \xi^\alpha} = 0$ in locally flat (inertial) coordinates at each point.

General coordinates:

$$\frac{\partial V_{IJ}^\mu(\xi)}{\partial \xi^\alpha} = \frac{\partial x^\nu}{\partial \xi^\alpha} \frac{\partial}{\partial x^\nu} \underbrace{\left[V_{IJ}^\nu \frac{\partial \xi^\mu}{\partial x^\nu} \right]}_{V_{IJ}^\mu \text{ in } x\text{-coords.}}$$

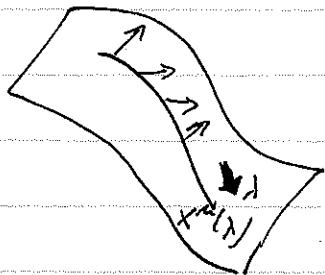

$$= \frac{\partial x^\nu}{\partial \xi^\alpha} \left[\frac{\partial \xi^\mu}{\partial x^\sigma} \frac{\partial V^\sigma}{\partial x^\nu} + V^\sigma \frac{\partial^2 \xi^\mu}{\partial x^\nu \partial x^\sigma} \right]$$

$$= \frac{\partial x^\nu}{\partial \xi^\alpha} \frac{\partial \xi^\mu}{\partial x^\sigma} \underbrace{\left[\frac{\partial V^\sigma}{\partial x^\nu} + V^\sigma \frac{\partial x^\delta}{\partial \xi^\beta} \frac{\partial^2 \xi^\mu}{\partial x^\nu \partial x^\delta} \right]}_{\nabla_\alpha^\mu}$$

$$\boxed{\frac{\partial V_{IJ}^\mu}{\partial \xi^\alpha} = \frac{\partial x^\nu}{\partial \xi^\alpha} \frac{\partial \xi^\mu}{\partial x^\sigma} V^\sigma_{;\nu}}$$

The condition for a vector field to be constant in curved space is $V^{\mu}_{;\nu} = 0$.

Constant Derivative Along a Curve

Locally Cartesian (inertial) coordinates $\xi^{\alpha}(\lambda)$

$$\frac{DV_{LI}^{\mu}}{D\lambda} = \lim_{\Delta \rightarrow 0} \frac{V_{LI}^{\mu}(\lambda + \Delta) - V_{LI}^{\mu}(\lambda)}{\Delta}$$

$$\frac{DV_{LI}^{\mu}}{D\lambda} = \frac{d\xi^{\alpha}}{d\lambda} \frac{\partial V_{LI}^{\mu}}{\partial \xi^{\alpha}} = \frac{d\xi^{\alpha}}{d\lambda} \frac{\partial x^{\nu}}{\partial \xi^{\alpha}} \frac{\partial g^{\mu}}{\partial x^{\nu}} V^{\sigma} j_{\sigma}$$

$$= \underbrace{\frac{\partial g^{\mu}}{\partial x^{\sigma}} \left(\frac{dx^{\sigma}}{d\lambda} V^{\sigma} j_{\sigma} \right)}_{\frac{DV^{\mu}}{D\lambda}}$$

$$\frac{DV^{\mu}}{D\lambda} = \frac{dx^{\nu}}{d\lambda} \left(\frac{\partial V^{\mu}}{\partial x^{\nu}} + \Gamma^{\mu}_{\nu\sigma} V^{\sigma} \right)$$

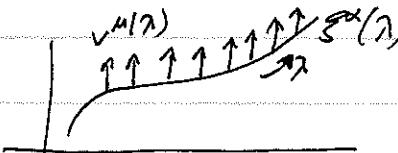

$$\boxed{\frac{DV^{\mu}}{D\lambda} = \frac{dx^{\nu}}{d\lambda} + \Gamma^{\mu}_{\nu\sigma} \frac{dx^{\sigma}}{d\lambda} V^{\nu}}$$

Note that this last expression defines the covariant derivative along a curve even for vector fields defined only along the curve ($1, \text{e.g. } x^{\mu}(\lambda)$ describing the trajectory of a particle).

Parallel Transport of Vectors

Keep vector constant with respect to itself along a trajectory

Flat space:

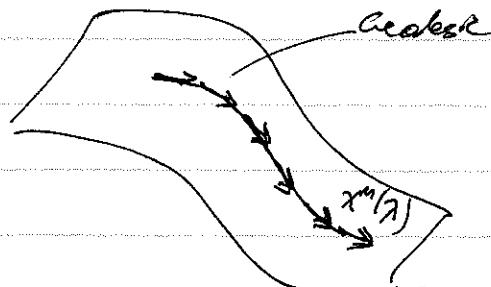

$$\frac{DV^M}{Dx} = 0 \leftarrow \text{defines parallel transport}$$

$$\boxed{\frac{dV^M}{dx} = -\Gamma_{VJ}^M \frac{dx^J}{dx} V^J}$$

parallel transport equation.

Along a geodesic the tangent vector $V^M = \frac{dx^M}{dx}$ is parallel transported.

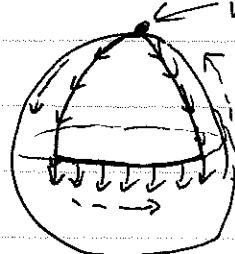

$$\boxed{\frac{D}{dx} \left(\frac{dx^M}{dx} \right) = 0 \rightarrow \frac{d^2x^M}{dx^2} + \Gamma_{V0}^M \frac{dx^V}{dx} \frac{dx^0}{dx} = 0}$$

Geodesic Eqn.

child

Curvature

In curved spaces, parallel transport of a vector along a ^{closed} loop does not generally leave a vector invariant upon traversing a full cycle.

Def: A manifold is flat if any vector parallel transported along any closed loop returns the vector to itself.

Along path from A to B: $\frac{dV^\alpha}{d\tau} = 0$

$$\frac{dV^\alpha}{d\tau} = -\Gamma_{\mu 1}^\alpha \frac{dx^1}{d\tau} V^\mu, \quad \frac{\partial V^\alpha}{\partial x^\mu} + \Gamma_{\mu\nu}^\alpha V^\nu = 0 \text{ along trajectory.}$$

$$V^\alpha(B) = V^\alpha(A) + \int_{x^2=a}^{x^2=b} dx^1 (-\Gamma_{\mu 1}^\alpha V^\mu)$$

$$\text{Similarly, } V^\alpha(C) = V^\alpha(B) + \int_{x^1=a+\delta a}^{x^1=a} (-\Gamma_{\mu 2}^\alpha V^\mu) dx^2$$

$$V^\alpha(D) = V^\alpha(C) + \int_{x^2=b+\delta b}^{x^2=b} dx^1 (\Gamma_{\mu 1}^\alpha V^\mu)$$

$$V^\alpha(A_{\text{return}}) = V^\alpha(D) + \int_{x^1=a}^{x^1=a+\delta a} (\Gamma_{\mu 2}^\alpha V^\mu) dx^2$$

$$V^\alpha(A_{\text{return}}) - V^\alpha(A) = \int_{x^2=a}^{x^2=b+\delta b} dx^2 \Gamma_{\mu 2}^\alpha V^\mu - \int_{x^2=a+\delta b}^{x^2=b} \Gamma_{\mu 2}^\alpha V^\mu dx^2$$

$$+ \int_{x^2=b+\delta b}^{x^2=b} dx^1 \Gamma_{\mu 1}^\alpha V^\mu - \int_{x^2=b}^{x^2=a} \Gamma_{\mu 1}^\alpha V^\mu dx^1$$

$$= \int_b^{b+\delta b} dx^2 \delta a \left(-\frac{\partial}{\partial x^1} (\Gamma_{\mu 2}^\alpha V^\mu) \right) + \int_a^{a+\delta a} dx^1 \delta b \left(\frac{\partial}{\partial x^2} (\Gamma_{\mu 1}^\alpha V^\mu) \right)$$

$$= \delta a \delta b \left[-\frac{\partial}{\partial x^1} (\Gamma_{\mu 2}^\alpha V^\mu) + \frac{\partial}{\partial x^2} (\Gamma_{\mu 1}^\alpha V^\mu) \right]$$

$$V^\alpha(A_{\text{return}}) - V^\alpha(A) =$$

$$= \delta a \delta b \left\{ - \left(\frac{\partial}{\partial x^1} \Gamma_{m2}^\alpha \right) V^m - \Gamma_{m2}^\alpha \frac{\partial}{\partial x^1} V^m + \left(\frac{\partial}{\partial x^2} \Gamma_{m1}^\alpha \right) V^m + \Gamma_{m1}^\alpha \frac{\partial}{\partial x^2} V^m \right\}$$

The vector V^m is parallel transported along the loops, so

$$\frac{\partial V^\alpha}{\partial x^1} = - \Gamma_{m1}^\alpha V^m \quad \text{or} \quad \frac{\partial V^\alpha}{\partial x^2} = - \Gamma_{m2}^\alpha V^m$$

along appropriate portions of the loops.

$$\Rightarrow V^\alpha(A_{\text{return}}) - V^\alpha(A) = \delta V^\alpha$$

$$= \delta a \delta b \left\{ \frac{\partial}{\partial x^2} \Gamma_{m1}^\alpha - \frac{\partial}{\partial x^1} \Gamma_{m2}^\alpha + \Gamma_{\beta 2}^\alpha \Gamma_{\mu 1}^\beta - \Gamma_{\beta 1}^\alpha \Gamma_{\mu 2}^\beta \right\} V^m$$

$$\delta V^\alpha = \delta a \delta b R_{m12}^\alpha V^m$$

$\uparrow \delta b \text{ in } x^2\text{-direction}$
 $\uparrow \delta a \text{ in } x^1\text{-direction}$

More generally, if V^m is parallel transported around loops spanning δa in x^σ -direction, δb in x^λ directions ($\sigma \neq \lambda$):

$$\boxed{\delta V^\alpha = \delta a \delta b R_{m\sigma\lambda}^\alpha V^m}$$

$$\boxed{R_{m\sigma\lambda}^\alpha = \frac{\partial \Gamma_{m\sigma}^\alpha}{\partial x^\lambda} - \frac{\partial \Gamma_{m\lambda}^\alpha}{\partial x^\sigma} + \Gamma_{\delta\lambda}^\alpha \Gamma_{m\sigma}^\delta - \Gamma_{\delta\sigma}^\alpha \Gamma_{\lambda m}^\delta}$$

Riemann Curvature tensor

Exercise: Show that $R_{m\sigma\lambda}^\alpha$ is a tensor.

* Space (time) is flat iff. $R_{m\sigma\lambda}^\alpha = 0$ everywhere.

Properties of $R^{\alpha}_{\mu\nu\rho\gamma}$:

- 1) $R^{\alpha}_{\mu\nu\rho\gamma}$ is the only tensor that can be constructed from $g_{\mu\nu}$ and its first and second derivatives.
- 2) $R^{\alpha}_{\mu\nu\rho\gamma}$ can also be defined in terms of the commutator of covariant derivatives:

$$V_{\lambda\mu\nu jk} - V_{\mu jk\nu} = -V_{\alpha} R^{\alpha}_{\mu\nu jk}$$

$$V^{\lambda}_{\mu\nu jk} - V^{\lambda}_{\mu k j\nu} = V^{\sigma} R^{\lambda}_{\sigma\nu jk}$$

$$3) \text{ Define } R_{\lambda\mu\nu k} = g_{\lambda\sigma} R^{\sigma}_{\mu\nu k}$$

$$R_{\lambda\mu\nu k} = \frac{1}{2} \left\{ \frac{\partial^2 g_{\lambda\nu}}{\partial x^{\mu} \partial x^{\lambda}} - \frac{\partial^2 g_{\mu\nu}}{\partial x^{\lambda} \partial x^{\mu}} - \frac{\partial^2 g_{\lambda k}}{\partial x^{\nu} \partial x^{\lambda}} + \frac{\partial^2 g_{\mu k}}{\partial x^{\nu} \partial x^{\mu}} \right\} \\ + g_{\lambda\sigma} [\Gamma^{\gamma}_{\nu\lambda} \Gamma^{\sigma}_{\mu k} - \Gamma^{\gamma}_{\mu\lambda} \Gamma^{\sigma}_{\nu k}]$$

$$4) R_{\lambda\mu\nu k} = R_{\nu k \lambda \mu}$$

$$R_{\lambda\mu\nu k} = -R_{\mu\nu k\lambda} = -R_{\mu k \lambda \nu} = +R_{\lambda \mu \nu k}$$

Algebraic
Relativity

$$R_{\lambda\mu\nu k} + R_{\lambda k \mu \nu} + R_{\lambda \nu k \mu} = 0$$

Useful contractions of $R^\lambda_{\mu\nu k}$:

$$R_{\mu k} = R^\lambda_{\mu\nu k} \quad \text{Ricci tensor}$$

$$R = g^{\mu k} R_{\mu k} \quad \text{Curvature Scalar}$$

Bianchi Identities

In a locally Cartesian (orthonormal) coordinate system,

$$R^\lambda_{\mu\nu} = 0, \text{ but } \frac{\partial}{\partial x^\alpha} R^\lambda_{\mu\nu} \neq 0.$$

$$R_{\mu\nu k l j \gamma} = \frac{1}{2} \frac{\partial}{\partial x^\gamma} \left(\frac{\partial^2 g_{\lambda\nu}}{\partial x^k \partial x^l} - \frac{\partial^2 g_{\mu\nu}}{\partial x^k \partial x^l} - \frac{\partial^2 g_{\lambda k}}{\partial x^m \partial x^\nu} + \frac{\partial^2 g_{\mu k}}{\partial x^m \partial x^\nu} \right)$$

$$\text{Exercise: } [R_{\mu\nu k l j \gamma} + R_{\mu k l \gamma v j} + R_{\mu k l \gamma j v}] = 0 \quad \text{cyclic permutations}$$

This is a covariant relation so it is true in arbitrary frames.

Contract with $g^{\mu\nu}$:

$$[R_{\mu k l j \gamma} - R_{\mu k j l \gamma} + R_{\mu k l \gamma j} = 0]$$

Contract w/ $g^{\mu k}$:

$$\begin{aligned} & R_{j \gamma} - R^{\mu}{}_{\gamma \mu} - R^{\nu}{}_{\gamma \nu} = 0 \\ \Rightarrow & (R^{\mu}{}_{\gamma} - \frac{1}{2} \delta^{\mu}_{\gamma} R)_{;\mu} = 0 \end{aligned}$$

$$[(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R)_{;\mu} = 0]$$
