

Sources of Cosmological Data include Type Ia supernova surveys of redshift vs. brightness (a proxy for distance); the power spectrum of the Cosmic Microwave Background (which so far agrees with predictions of inflation); the distribution of galaxies and galaxy clusters; gravitational lensing surveys; galactic rotation curves; etc.

The resulting picture is that the universe is composed of:

by energy density
4.6% ordinary "baryonic" matter
23.5% Dark Matter
71.9% Dark Energy
(WMAP 9-year, June 2013)

Dark Matter \approx pressureless fluid $w=0$, $\Omega_M = 0.235$

Dark Energy \approx cosmological const. $w=-1$, $\Omega_\Lambda = 0.719$

Baryonic Matter = intergalactic gas, stars, etc., $\Omega_B = 0.04$
assumes $\Omega_M + \Omega_\Lambda + \Omega_B = 1$

Age of universe: 13.8 billion yrs.
 $H_0 = 69.7 \text{ km/s/Mpc}$ } WMAP 9-yr.
 $1.33 \times 10^6 \text{ light yrs.}$

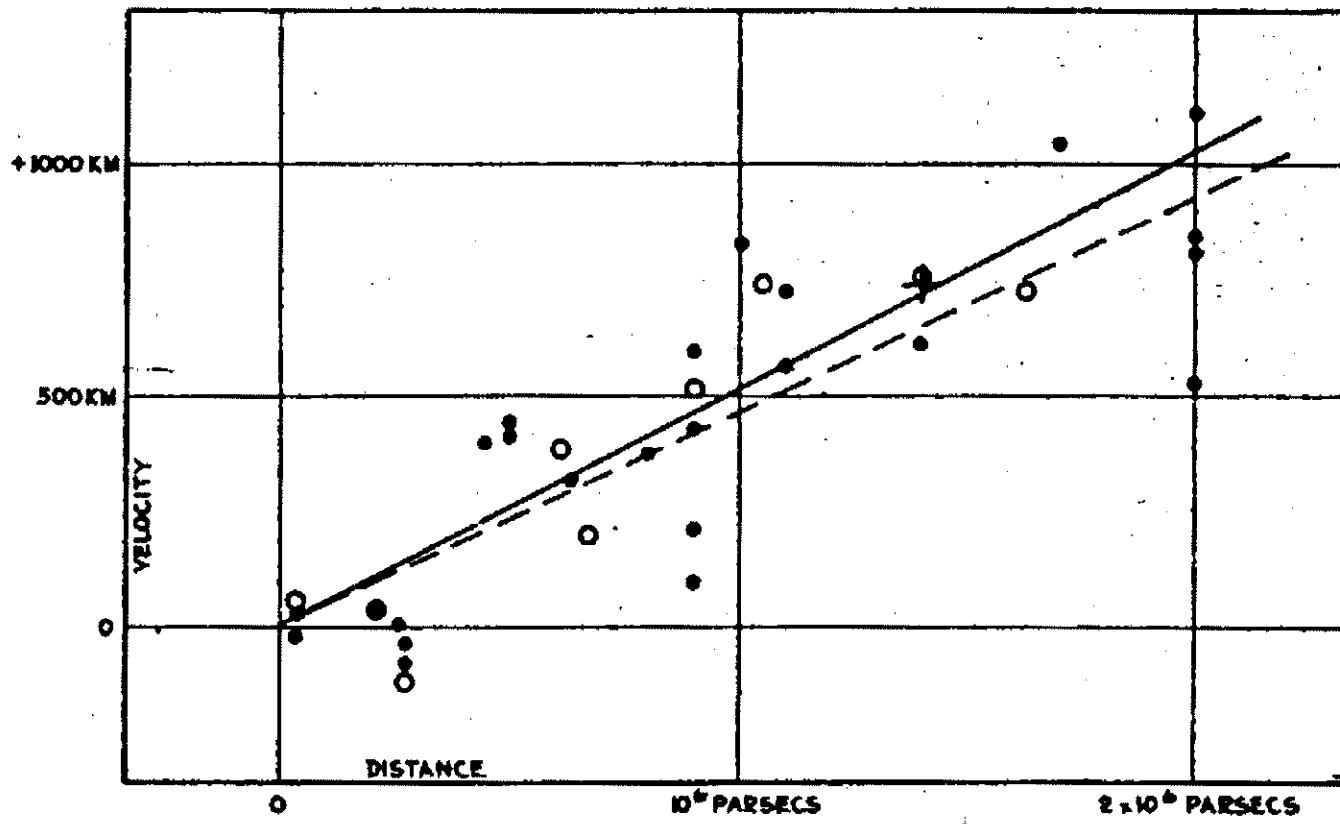

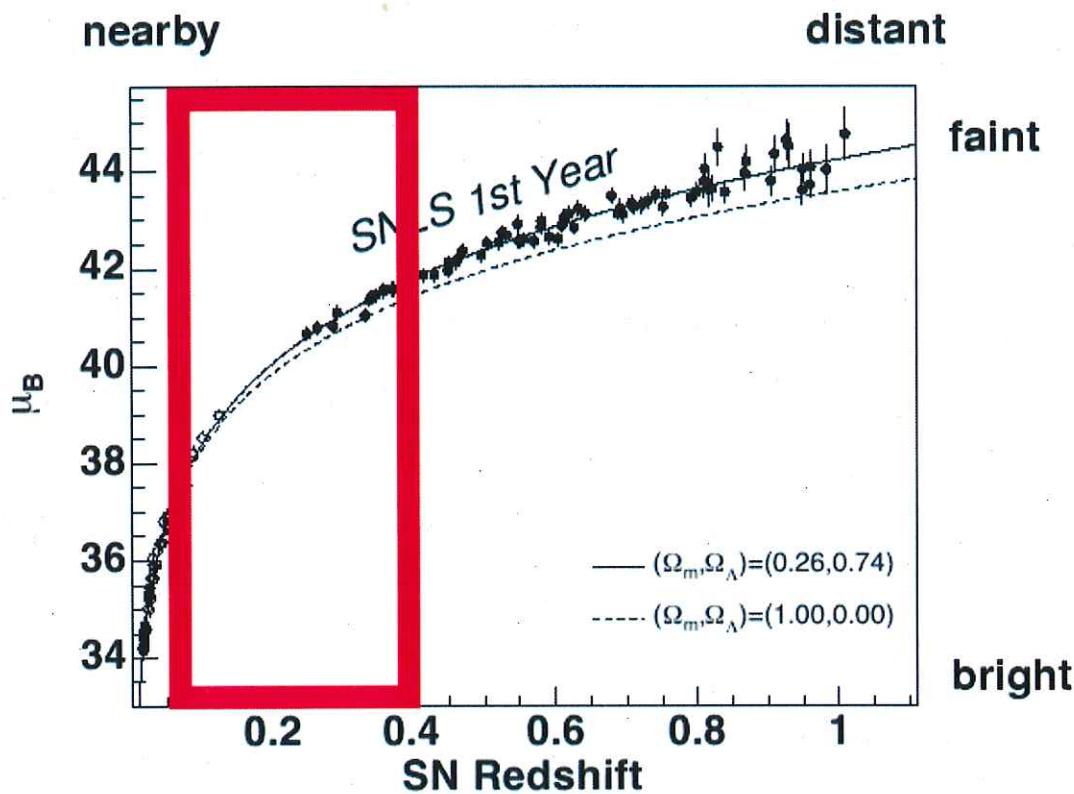

FIGURE 1

Edwin Hubble's original (1929) velocity-distance data

Estimated Hubble constant $H_0 \approx 500 \text{ km/s/Mpc}$.

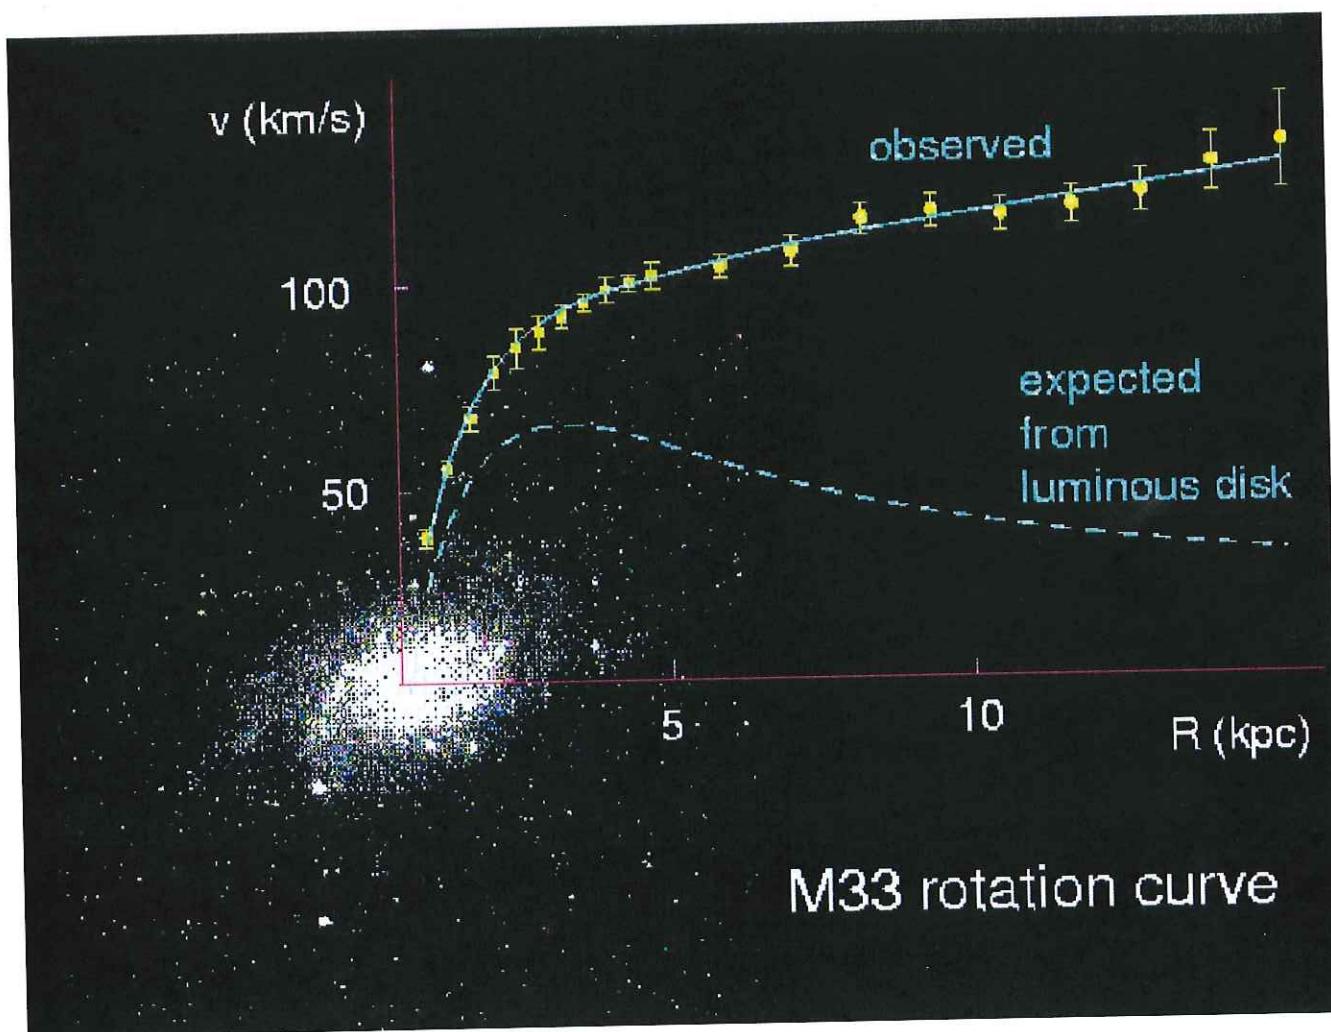

Today's measured value (WMAP 9-yr): 70 km/s/Mpc

COSMIC CURL

The BICEP2 instrument observed a faint but distinctive twisting pattern, or spin, known as a curl or B-mode, in the polarization of the cosmic microwave background. This is the first evidence for gravitational waves generated by rapid inflation of the Universe some 13.8 billion years ago.

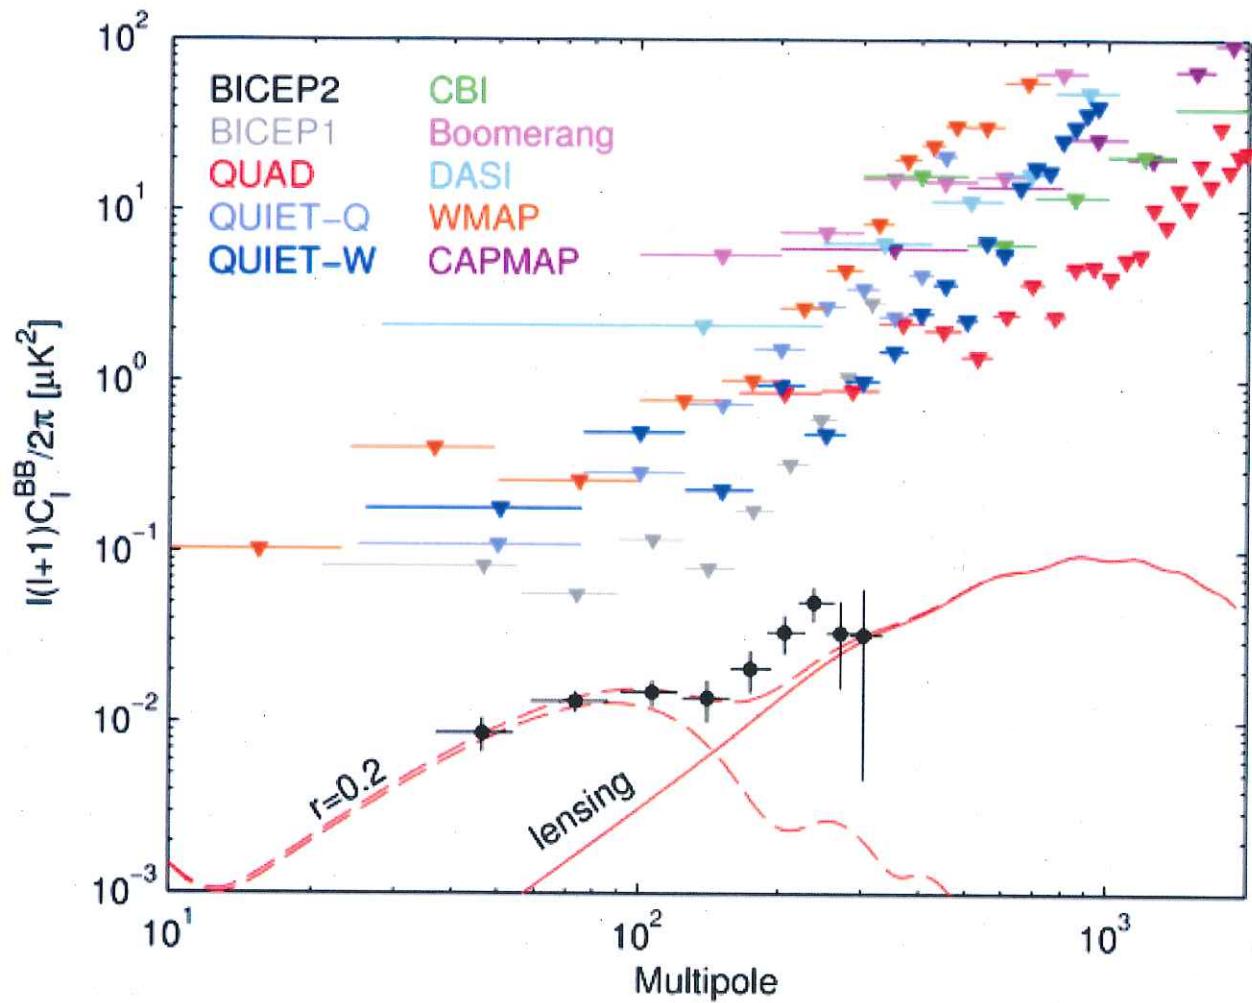

Spin intensity

■ Clockwise ■ Anti-clockwise

Polarization strength and orientation at different spots on the sky.
