# Matrices and plotting. 

Eugeniy E. Mikhailov

The College of William \& Mary

Lecture 03

## Matrices

Recall that Matlab stands for Matrix Laboratory

- So deep inside everything is a matrix (array)
- a number is the case of $1 \times 1$ matrix

Let's create a $3 \times 5$ matrix ( 3 rows and 5 columns)
>> Mz=zeros $(3,5)$
$\mathrm{Mz}=$

| 0 | 0 | 0 | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 |

This is not the only way, but it is one which make sure that matrix is filled with zeros
Note: it is possible to have more than 2 dimensional arrays.

## Matrix elements assignment

>> $\mathrm{Mz}(2,4)=1$
$\mathrm{Mz}=$
0
0
0

## Alternative way to assign a matrix

Notice ... mark, which means that input continues on the next line

## Strength of Matlab

## Native matrix operations

$\gg \mathrm{Mz}+5$
ans $=$

5 $\quad 5 \quad$|  |  |  |  |
| :--- | :--- | :--- | :--- |
| 5 | 5 | 5 | 5 |
| 5 | 5 | 5 | 6 |

| $\gg$ | $\mathrm{Mz} * 2$ |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| ans $=$ |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 2 | 0 |
| 0 | 0 | 0 | 0 | 8 |

## More example on matrices operations

| $\gg$ | $M z+M z$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| ans $=$ |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 2 | 0 |
| 0 | 0 | 0 | 0 | 8 |

Matrix multiplication according to the linear algebra rules

| $\gg$ | $\mathrm{Mz} \star \mathrm{Mz}^{\prime}$ |  |
| :--- | ---: | ---: |
| ans $=$ |  |  |
| 0 | 0 | 0 |
| 0 | 1 | 0 |
| 0 | 0 | 16 |

Here $M z^{\prime}$ corresponds to transposed matrix Mz, i.e. $M z^{\prime}(i, j)=M z(j, i)$

## Matrix as a function argument

A function can take a matrix as the function argument, it will evaluate the value of the function for each matrix element

| $\gg \sin (M z)$ |  |  |  |  |
| :--- | :--- | :--- | ---: | ---: |
| ans $=$ |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0.8415 | 0 |
| 0 | 0 | 0 | 0 | -0.7568 |

## Vectors and column vector

A special case of the matrix is it has only one dimension. Such matrices generally called vectors

- $m \times 1$ column vector
- $1 \times m$ just a vector

To create a vector

|  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

## Column vector

$$
\begin{aligned}
& \text { Construction of column vector } \\
& \gg \mathrm{vC}=[1 ; 2 ; 3] \\
& \mathrm{vc}= \\
& 1 \\
& 2 \\
& 3
\end{aligned}
$$

## Yet one more way to create matrix

If you have prearranged vectors or column vectors you can use them
$\gg \mathrm{VC}=[1 ; 2 ; 3] ;$
$\gg$
$\mathrm{MC}=[\mathrm{VC}$,
$\mathrm{MC}=$
1

| $\mathrm{V}=$ |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| $\gg \mathrm{Mv}=\left[\begin{array}{lll}\mathrm{v} ; & 2 * v ; ~ & 3 * v]\end{array}\right.$ |  |  |  |  |  |  |  |
| $\mathrm{Mv}=$ |  |  |  |  |  |  |  |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 |
| 3 | 6 | 9 | 12 | 15 | 18 | 21 | 24 |

## Colon (:) operator

The : operator is extremely useful to create vectors or matrix indexes It usually take form start : increment: stop and creates a vector with following values

```
    [ start, start+increment, ... , start+m*increment]
```

where start $+\mathrm{m} *$ increment $\leq$ stop
>> $\mathrm{v}=5: 2: 11$
$\mathrm{v}=$

| 5 | 7 | 9 | 12 |
| :--- | :--- | :--- | :--- |

It is also possible to have negative increment
>> $\mathrm{v} 2=12:-3: 1$
$\mathrm{v} 2=$

| 12 | 9 | 6 | 3 |
| :--- | :--- | ---: | :--- |

## Colon (:) operator continued

Another form start: stop in this case increment $=1$

| v1 = |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 |

Notice that
>> $\mathrm{v} 3=5: 1$
$\mathrm{v} 3=$
$\quad$ Empty matrix: 1-by-0
Produce somewhat unexpected result, since default increment is positive

## Slicing matrices

It is handy to choose a subset (block) from the matrix We have a matrix Mv with size $3 \times 8$ and we want to choose all elements from columns 2,5,6

```
>> Mv
Mv =
\begin{tabular}{rrrrrrrr}
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\
2 & 4 & 6 & 8 & 10 & 12 & 14 & 16 \\
3 & 6 & 9 & 12 & 15 & 18 & 21 & 24
\end{tabular}
>> Mv(:,[2,5,6])
ans =
2 5 6
4 10}1
6 15 18
```

The meaning of the : now is choose all. Notice also that we use vector to specify desired columns

## Plotting

Suppose you have a vector with values of $x$ coordinates and we want to plot $\sin (x)$.

```
>> x=linspace(0,2*pi,10)
x =
0 0.6981 1.3963 2.0944 2.7925 3.4907
4.1888 4.8869 5.5851 6.2832
>> y=sin(x)
y =
0 0.6428 0.9848 0.8660 0.3420 -0.3420
-0.8660 -0.9848 -0.6428 -0.0000
>> plot(x,y,'o') % other way plot(x,sin(x),'o')
>> % every plot MUST have title, x and y labels
>> xlabel('x (radians)')
>> ylabel('sin(x)')
>> title('Plot of sin(x)')
```

## Saving plots

Now we want to save the figure, use print
>> print('-dpdf', 'sin_of_x')
This will generate file sin_of_x.pdf notice automatic fileextension addition.
The '-d' switch stands for output format ('pdf', 'ps', 'eps', 'png"... )
To generate 'png' file
>> print('-dpng', '-r100', 'sin_of_x')

By default figure size is $8 \times 6$ inches, the ' $-r$ ' switch tells the figure resolution in dpi (dots per inch). In this case it is 100 dpi so resulting image will be $800 \times 600$ pixels.

For 3D plots, please see help files for plot3, mesh, surf

## Special array arithmetic operators

There are special arithmetic operators which applied to the elements of matrices (disregard linear algebra rules)

- . *

```
>> x=1:3
x = 1 2 
>> x*x % will generate an error
>> X.*2
ans=1
4
9
```

- . /

```
>> X./X
ans=1 1
```

$\gg \mathrm{x} \cdot \wedge 2$
ans $=1$
4
9

## Special array arithmetic operators continued

```
>>m=[1,2,3;4,5,6;7,8,9]
m =
1 2 3
4 5 6
7 8 9
```

Linear algebra rules

| $\gg m * m$ |  |  |
| :--- | :--- | :--- |
| ans $=$ |  |  |
| 30 | 36 | 42 |
| 66 | 81 | 96 |
| 102 | 126 | 150 |

Element wise operation

| $\gg$ | $m . * m$ |  |
| :--- | :--- | :--- |
| $\mathrm{ans}=$ |  |  |
| 1 | 4 | 9 |
| 16 | 25 | 36 |
| 49 | 64 | 81 |

## Special array arithmetic operator .

| 1 | 2 | 3 |
| :---: | :---: | :---: |
| 4 | 5 | 6 |
| 7 | 8 | 9 |

Linear algebra rules
$\gg \mathrm{m}^{\wedge} \mathrm{m}$ \% undefined
$\gg m \cdot \wedge m$
ans $=$
ans $=$

| 1 | 4 | 27 |
| :--- | :--- | :--- |
| 256 | 3125 | 46656 |
| 823543 | 16777216 | 387420489 |

## Special array arithmetic operator ./

```
>>m=[1,2,3;4,5,6;7,8,9]
m =
1 2 3
4
7 8 9
```

Linear algebra rules

| $\begin{aligned} & \gg \mathrm{m} / \mathrm{m} \\ & \mathrm{ans}= \end{aligned}$ |  |  |
| :---: | :---: | :---: |
|  |  |  |
| 1 | 0 | 0 |
| 0 | 1 | 0 |
| 0 | 0 | 1 |

Element wise operation

| $\gg m . / m$ |  |  |
| :--- | ---: | :--- |
| ans $=$ |  |  |
| 1 | 1 | 1 |
| 1 | 1 | 1 |
| 1 | 1 | 1 |
