## Data interpolation - filling the voids

Very rarely there is enough data. Often taking a data point takes a lot of time or it is expensive. But we would like to have some presentation of the system in the voids.

Notes

---

## Nearest neighbor interpolation

The name says it all. For each interpolated point  $x_{interpolated}$  find its nearest neighbor along the  $x_i$  axis in the data set and use its  $y_i$  value.

Notes

---

---

---

---

---

---

---

---

## Linear interpolation

We will split our data set with  $N$  points to  $N - 1$  intervals and interpolate the values in the given interval as a line passing through the border points  $(x_i, y_i)$  and  $(x_{i+1}, y_{i+1})$

## Polynomial fit

You can always find a polynomial of  $N - 1$  degree passing through  $N$  data points.

$$y(x) = p_1x^n + p_2x^{n-1} + \dots + p_nx + p_{n+1}$$

Matlab has the 'polyfit' function which returns the polynomial coefficient.

```
% calculate coefficients
p=polyfit(xdata, ydata, (length(xdata)-1) );
% interpolate
yi=polyval(p, xi);
```

Interpolated values tend to oscillate for the polynomial of a high degree.  
**Do not use it!**  
Unless you know what you are doing.

## Cubic spline interpolation

We will interpolate  $N$  data points by a polynomial of 3rd degree for each  $i_{th}$  interval between data point

$$f_i(x) = p_1x^3 + p_2x^2 + p_3x + p_4, x \in [x_i, x_{i+1}]$$

## Cubic spline interpolation demystified

We will interpolate  $N$  data points by a polynomial of 3rd degree for each  $i_{th}$  interval between data point

$$f_i(x) = p_1x^3 + p_2x^2 + p_3x + p_4, x \in [x_i, x_{i+1}]$$

Interpolation must pass through data points

$$\begin{aligned} f_i(x_i) &= y_i \\ f_i(x_{i+1}) &= y_{i+1} \end{aligned}$$

Two data points (at the interval border) are not enough to set equations for 4 polynomial coefficients.

So we will request twice continuous differentiable

At the end points second derivative must be set to 0 (so called natural cubic spline)

$$\begin{aligned} f'_i(x_{i+1}) &= f'_{i+1}(x_{i+1}) \\ f''_i(x_{i+1}) &= f''_{i+1}(x_{i+1}) \end{aligned} \quad \begin{aligned} f''_1(x_1) &= 0 \\ f''_{N-1}(x_N) &= 0 \end{aligned}$$

## Matlab built in interpolation

Use matlab `interp1(xdata, ydata, xi, method)` for some of above methods

Where `method` could be

- 'nearest' Nearest neighbor interpolation
- 'linear' Linear interpolation (default)
- 'spline' Cubic spline interpolation
- other see more in help

Notes

Notes

Notes

Notes

Extrapolation - voids outside the measurements region

**Do not extrapolate!!!**

Unless you have a physical model of the process.
