## Bubble sort method

Some one give us a vector of unsorted numbers.  
We want to obtain the vector sorted in ascending order.

- assign `IndexOfTheLastToCheck` be the *index* of the vector end
- start sweeping from the beginning of the vector
- Compare the 2 consequent elements till we reach the `IndexOfTheLastToCheck`
- if the left element is larger we swap these 2 elements
- move to the next pair to the right i.e. move to the item 2
  - notice that at the end of the sweep the *index* of the last element to check holds the largest element
  - so next sweep does not have to be that long.
  - it is shorter by one element
  - i.e. the *index* of the last element to check should be decreased by 1
- decrease `IndexOfTheLastToCheck` by 1
- if `IndexOfTheLastToCheck > 1` repeat from the item 1

```
x = [3, 1, 4, 5, 2]
first sweep
x = [3, 1, 4, 5, 2] swap
x = [1, 3, 4, 5, 2] after swap
x = [1, 3, 4, 5, 2] no swap
x = [1, 3, 4, 5, 2] no swap
x = [1, 3, 4, 5, 2] swap
x = [1, 3, 4, 2, 5] sweep done
new sweep
x = [1, 3, 4, 2, 5] no swap
x = [1, 3, 4, 2, 5] no swap
x = [1, 3, 4, 2, 5] swap
x = [1, 3, 2, 4, 5] sweep done
new sweep
x = [1, 3, 2, 4, 5] no swap
x = [1, 3, 2, 4, 5] swap
x = [1, 2, 3, 4, 5] sweep done
last sweep
x = [1, 2, 3, 4, 5] no swap
x = [1, 2, 3, 4, 5] sweep done
```

## Bubble sort properties

- **This is the worst of all working algorithm!**
- The execution time of this algorithm is  $\mathcal{O}(N^2)$
- **Never use it in the real life!**
- However it is very simple to program, and does not require extra memory for execution.

---

---

## Quick sort method

Much better yet simple algorithm

Let's discuss recursive realization

We will name our sorting function as `qsort`.

- choose a pivot point value
  - let's choose the pivot at the middle of the vector
  - `pivotIndex=floor(N/2)`
  - `pivotValue=x(pivotIndex)`
- create two vectors which hold lesser and larger than `pivotValue` elements of the input vector.
- now concatenate the result of `xs=[qsort(lesser), pivotValue, qsort(larger)]`
- done

Notes

---

---

---

---

---

---

---

## Quick sort summary

- usually fast
- typical execution time  $\mathcal{O}(N \log_2 N)$
- but it is not guaranteed
  - However for **certain input vectors** execution time could be as long as  $\mathcal{O}(N^2)$

## Heap

Heap is a structure where parent element is larger or equal to its children.

The top most element of the heap is called root.

Notes

---

---

---

---

---

---

---

## Heap sorting method

- 1 Fill the heap from the input vector elements
  - 1 take the element and place it at the bottom of the heap
  - 2 sift-up (bubble up) this element
  - 3 do the same with the next element
- 2 remove the root element since it is the largest
- 3 rearrange the heap i.e. sift-down
  - 1 take the last bottom element
  - 2 place it at the root
  - 3 check if parent is larger than children
    - 1 find the largest child element
    - 2 if the largest child is larger than parent swap them and repeat the check
- 4 repeat step 2 until no elements left in the heap

Heap sorting complexity  $\mathcal{O}(N \log_2 N)$

---

---

---

---

## Filling (sift-up) the heap

### Step 1

Place new element at the bottom of the heap

Notes

---

---

---

---

---

---

---

## Filling (sift-up) the heap

### Step 2

Check if parent is larger than child. If so swap them and repeat step 2.

## Filling (sift-up) the heap

### Step 2

Check if parent is larger than child. If so swap them and repeat step 2.

## Filling (sift-up) the heap

### Step 2

Check if parent is larger than child. If so swap them and repeat step 2.

## Removing from the heap (sift-down) the heap

### Step 1

Remove the root element

## Removing from the heap (sift-down) the heap

### Step 2

Place the last element of the heap to the root

Eugeniy Mikhailov (W&M) Practical Computing Lecture 27 13 / 18

## Removing from the heap (sift-down) the heap

### Step 3

Check if parent is smaller than the largest child. If so swap and repeat step 3 else go to step 1

Eugeniy Mikhailov (W&M) Practical Computing Lecture 27 14 / 18

## Removing from the heap (sift-down) the heap

### Step 3

Check if parent is smaller than the largest child. If so swap and repeat step 3 else go to step 1

Eugeniy Mikhailov (W&M) Practical Computing Lecture 27 15 / 18

## Removing from the heap (sift-down) the heap

Sequence repeats

### Step 1

Remove the root element

Eugeniy Mikhailov (W&M) Practical Computing Lecture 27 16 / 18

## Vector heap representation

- Heap nodes are numbered consequently these numbers represent the node position in the vector.
- notice that parent and children have very simple relationship
  - if parent node index is  $i$ 
    - child 1 index is  $2i$
    - child 2 index is  $2i + 1$
  - if we know child index ( $i$ ) then
    - parent index is  $\text{floor}(i/2)$

## Matlab built in 'issorted'

Easy check if an array is sorted can be done with `issorted` which returns `true` or `false`.

```
>> x=[1,2,3];  
>> issorted(x)  
ans =  
1
```

`issorted` checks only for `ascending` order, for example

```
>> x=[3,2,1];  
>> issorted(x)  
ans =  
0
```

Recall that '0' is equivalent of `false` in Matlab
