Transistors applications: AC amplifiers

Eugeniy E. Mikhailov

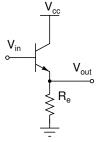

The College of William & Mary

Lecture 07

Eugeniy Mikhailov(W&M) Electronics 1 Lecture 07 1/1

Summary of simple emitter follower

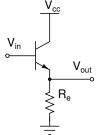

Advantages

- input impedance increase $Z_{in} = \beta R_e$
- power/current gain
- output does not depend on β
- simple

Eugeniy Mikhailov (W&M) Electronics 1 Lecture 07 2/1

Summary of simple emitter follower

Advantages

- input impedance increase $Z_{in} = \beta R_e$
- power/current gain
- ullet output does not depend on eta
- simple

Disadvantages

 input signal must be positive Notes

- even more it should be above 0.6 V
- no voltage gain

	·	D > 4 # > 4 2 > 4 2 > 2	20
Eugeniy Mikhailov (W&M)	Electronics 1	Lecture 07	2 / 1
Real life signal			

In real life signals usually swing around zero.

Push-Pull emitter follower improved

AC-coupled emitter follower

AC-coupled emitter follower

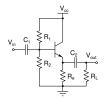

Design rules

- maximum output swing
 - $\bullet \ V_e = V_{cc}/2$
- ullet disregarding $V_{be}=0.6~{
 m V}$
 - $V_b \approx V_e = V_{cc}/2$ thus $R_1 = R_2$
- ullet quiescent current $I_e = V_e/R_e$
- we want $I_{R_1+R_2}\gg I_b$ factor of 10 for a safe margin $I_{R_1+R_2}\geq 10I_b=10I_e/\beta$ thus $R_1=R_2\leq R_e\beta/10$

AC-coupled emitter follower: capacitors choice

Notes

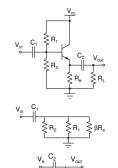

AC-coupled emitter follower: capacitors choice

From AC point of view

- Input is RC high-pass
 - $C = C_1$
 - $R = R_1 ||R_2||\beta R_e$
 - - $f_{3db} = \frac{1}{2\pi} \frac{1}{C_1(R_1||R_2||\beta R_e)}$ with above rules $R \approx R_1/2$

AC-coupled emitter follower: capacitors choice

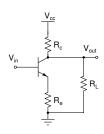

From AC point of view

- Input is RC high-pass
 - \bullet $C=C_1$

 - $\begin{array}{ccc} \bullet & C = C_1 \\ \bullet & R = R_1 ||R_2||\beta R_e \\ \bullet & f_{3db} = \frac{1}{2\pi} \frac{1}{C_1(R_1||R_2||\beta R_e)} \\ \bullet & \text{with above rules } R \approx R_1/2 \end{array}$
- Output is also RC high-pass
 - $C = C_2$

 - $f_{3db} = rac{1}{2\pi} rac{1}{C_2 R_L}$ for unloaded filter $R_L \gg R_e$
 - factor of 10 for a safe margin $R_L = 10R_e$

Common emitter (inverting) amplifier

Notes

Notes			

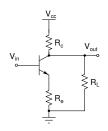

Common emitter (inverting) amplifier

- $I_c = I_e = (V_{in} 0.6V)/R_e$
- $V_{out} = V_{cc} R_c I_c$
- $V_{out} = V_{cc} R_c(V_{in} 0.6V)/R_e$
- $V_{out} = (V_{cc} + (0.6V)R_c/R_e) V_{in}R_c/R_e$
- gain $G = -R_c/R_e$
- attractive to put R_e = 0
 - transistor model fails
 - transistor emitter resistance

 $r_e = 25mV/I_c$ • gain $G = -R_c/r_e$

Common emitter amplifier signal output impedance

Common emitter amplifier signal output impedance

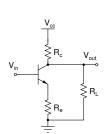

In the pass band we can neglect capacitors

$$\begin{array}{lll} V_{out} & = & V_{cc} - I_c R_c = V_{cc} - (I_{ce} + I_L) R_c \\ & = & (V_{cc} - I_{ce} R_c) - I_L R_c \\ & = & V_{th} - I_L R_{th} \end{array}$$

Common emitter amplifier signal output impedance

In the pass band we can neglect capacitors

$$V_{out} = V_{cc} - I_c R_c = V_{cc} - (I_{ce} + I_L) R_c$$

$$= (V_{cc} - I_{ce} R_c) - I_L R_c$$

$$= V_{th} - I_L R_{th}$$

Thévenin's equivalent

$$V_{th} = V_{cc} - I_{ce}R_c$$

 $R_{th} = R_c$

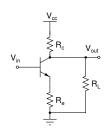

Notes

Notes

Notes

Common emitter amplifier signal output impedance

In the pass band we can neglect capacitors

$$V_{out} = V_{cc} - I_c R_c = V_{cc} - (I_{ce} + I_L) R_c$$
$$= (V_{cc} - I_{ce} R_c) - I_L R_c$$
$$= V_{th} - I_L R_{th}$$

Thévenin's equivalent

$$V_{th} = V_{cc} - I_{ce}R_c$$

 $R_{th} = R_c$

Rule of 10 must be satisfied

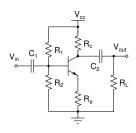

$$R_L \geq 10R_c$$
