## Homework 03

## Problem 1 (5 points)

Prove that for an orbit governed by

$$
\frac{p}{r}=1+e \cos (\theta)
$$

the semiminor axis $(b)$ is given by $p / \sqrt{1-e^{2}}$.

## Problem 2 (5 points)

Plot an orbit in $\mathrm{x}, \mathrm{y}$ coordinates for $p=1 \mathrm{~m}$ and $e=0.5$. Make sure that axes ratio is 1 , i.e. the plot is not squeezed.

## Problem 3 (5 points)

Suppose two masses with their mass ratio $m_{1} / m_{2}=3$ orbit each other and the semimajor axis of the orbit is $a=10^{4} \mathrm{~m}$ in the central of mass reference frame and the eccentricity is $e=0.2$. Plot orbits of both masses on the same plot as they orbit each other.

Make sure that axes ratio is 1, i.e. the plot is not squeezed.

## Problem 4 (5 points)

Solve problem 2.12 from the text book.

## Problem 5 (5 points)

Look at the notes at the page 3 of the lecture 06 notes. Proves that eq. 2 follows from eq.1.
