Outline

History of gravity

- Newton's laws
- Einstein's laws
- A bit of astrophysics
- Detectors
 - Gravitational wave interferometer
- Assorted LIGO pictures

Quantum optics

- Classical field
- Quantum field

Squeezing applications

- Squeezing and interferometers
- Squeezing enhanced magnetometry

Newton's laws 1687

Laws of motion and law of gravitation solved problems of astronomy and terrestrial physics.

- eccentric orbits
- tides

• perturbation of moon orbit due to sun Unified the work of Galileo, Copernicus and Kepler.

Did not explained precession of Mercury orbit

The General Theory of Relativity and theory of Gravity (1916)

- No absolute motion thus only relative motion
- Space and time are not separate thus four dimensional space-time
- Gravity is not a force acting at a distance thus warpage of space-time

General relativity

- A geometric theory connecting matter to spacetime
- Matter tells spacetime how to curve
- Spacetime tells matter how to move

important predictions

- $\bullet\,$ Light path bends in vicinity of massive object \rightarrow confirmed in 1919
- Gravitational radiation (waves) \rightarrow confirmed indirectly in 1974

Eugeniy Mikhailov (W&M)

quantum enhanced measurements and LIGO

March 03, 2015 5 / 45

Emission of gravitational radiation from pulsar PSR1913+16 leads to loss of orbital energy

- orbital period decreased by 14 sec from 1975 to 1994
- measured to 50 msec accuracy
- deviation grows quadratically with time

< 61 b

Nobel prize in 1997 Taylor and Hulse

∃ ► < ∃ ►</p>

Astrophysical sources of GW

- Coalescing compact binaries
 - objects: NS-NS, BH-NS, BH-BH
 - physics regimes: Inspiral, merger, ringdown

- Periodic sources
 - spinning neutron stars (pulsars)

Astrophysical sources of GW (cont)

- Burst events
 - Supernovae with asymmetric collapse

- Stochastic background
 - right after Big Bang $(t = 10^{-43} \text{ sec})$
 - continuum of sources

E&M (photons)

- Space as medium for field
- Accelerating charge
- Absorbed, scattered, dispersed by matter
- 10 MHz and up
- Light = not dark (but >95% of Universe is dark)

GW

- Spacetime itself ripples
- Accelerating aspherical mass
- Very small interaction; matter is transparent
- 10 kHz and down
- Radiated by dark mass distributions

New view to the universe

Eugeniy Mikhailov (W&M)

quantum enhanced measurements and LIGO

æ

Gravitational waves (GW)

- Predicted by the General Theory of Relativity
- Generated by aspherical mass distribution
- Induce space-time ripples which propagate with speed of light

New tool for astrophysics

GW stretch and squeeze space-time thus move freely floating objects

Strain - strength of GW
$$h = \frac{\Delta L}{L}$$
(1)

typical strain
$$h \sim 10^{-21}$$
(2)

March 03, 2015

11/45

Eugeniy Mikhailov (W&M)

Typical strain

Two neutron star

with a mass of 1.4 solar masses each orbiting each other with a frequency f = 400 Hz at a distance 2R = 20 km would generate strain $h \sim 10^{-21}$ at distance equal to 10^{23} m (distance to the Virgo cluster) For 4 km base line that would correspond to ΔL thousand times smaller than size of proton.

Detection of GW is difficult problem

quantum enhanced measurements and LIGO

Upgrade

Goals

- Factor of 15 increase in sensitivity
- inspiral range from 20 Mpc to 350 Mpc
- Factor of 3000 in event rate
 One day > entire 2-year initial
 data run
- Quantum-noise-limited interferometer

How

- better seismic isolation
- decreasing thermal noise
- higher laser power

Seismic isolation

Transition from classical to quantum field

Classical analog

- Field amplitude a
- Field real part $X_1 = (a^* + a)/2$
- Field imaginary part $X_2 = i(a^* a)/2$

Quantum approach

- Field operator â
- Amplitude quadrature $\hat{X_1} = (\hat{a}^\dagger + \hat{a})/2$
- Phase quadrature $\hat{\chi_2} = i(\hat{a}^{\dagger} \hat{a})/2$

36 / 45

Eugeniy Mikhailov (W&M)

Light consist of photons • $\hat{N} = a^{\dagger} a$ Commutator relationship • $[a, a^{\dagger}] = 1$ • $[X_1, X_2] = i/2$ Detectors measure number of photons N • Quadratures \hat{X}_1 and \hat{X}_2 Uncertainty relationship • $\Delta X_1 \Delta X_2 > 1/4$

Heisenberg uncertainty principle and its optics equivalent

Heisenberg uncertainty principle

 $\Delta p \Delta x \geq \hbar/2$

The more precisely the POSITION is determined, the less precisely the MOMENTUM is known, and vice versa

Heisenberg uncertainty principle and its optics equivalent
