"for decisive contributions to the LIGO detector and the observation of gravitational waves"

Rainer Weiss

Kip S. Thorne

Barry C. Barish

LIGO Scientific Collaboration

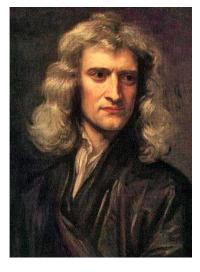

Newton's laws 1686

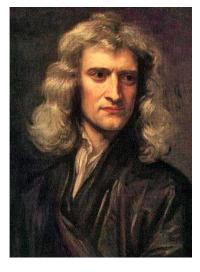

$$F_g = G \frac{m_1 m_2}{r^2}$$

Laws of motion and law of gravitation solved problems of astronomy and terrestrial physics.

- eccentric orbits
- tides
- perturbation of moon orbit due to sun

Unified the work of Galileo, Copernicus and Kepler.

Newton's laws 1686

$$F_g = G \frac{m_1 m_2}{r^2}$$

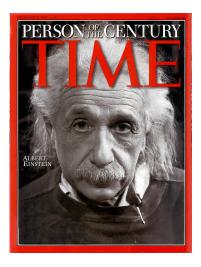

Laws of motion and law of gravitation solved problems of astronomy and terrestrial physics.

- eccentric orbits
- tides
- perturbation of moon orbit due to sun

Unified the work of Galileo, Copernicus and Kepler.

Time is not in the formula

Einstein's laws 1915

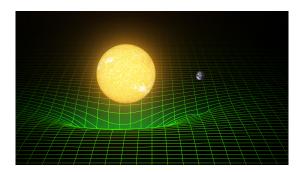

The General Theory of Relativity and theory of Gravity (1915)

- No absolute motion thus only relative motion
- Space and time are not separate thus four dimensional space-time
- Gravity is not a force acting at a distance thus warpage of space-time

General relativity

- A geometric theory connecting matter to spacetime
- Matter tells spacetime how to curve
- Spacetime tells matter how to move

important predictions

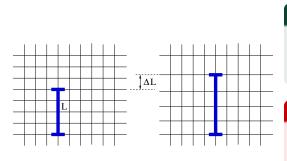

- \bullet Light path bends in vicinity of massive object \rightarrow confirmed in 1919
- Gravitational radiation (waves) → confirmed indirectly in 1974

Gravitational waves (GW)

- Predicted by the General Theory of Relativity
- Generated by aspherical mass distribution
- Induce space-time ripples which propagate with speed of light

GW stretch and squeeze space-time thus move freely floating objects

Strain - strength of GW

$$h = \frac{\Delta L}{L} \tag{1}$$

expected strain

$$h \sim 10^{-21}$$

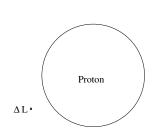

(2)

Gravitational waves (GW)

- Predicted by the General Theory of Relativity
- Generated by aspherical mass distribution
- Induce space-time ripples which propagate with speed of light

GW stretch and squeeze space-time thus move freely floating objects

Strain - strength of GW

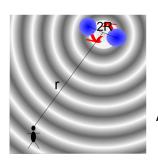

$$h = \frac{\Delta L}{L} \tag{1}$$

expected strain

$$h \sim 10^{-21}$$

(2)

Typical strain

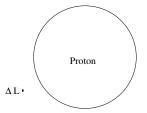

$$M_c = \frac{(m_1 m_2)^{3/5}}{(m_1 + m_2)^{1/5}}$$

$$h = 4 \frac{G}{c^2} \frac{M_c}{r} \left(\frac{G}{c^3} \pi f M_c \right)^{2/3}$$

Assuming $m_1 = m_2 = m$ and recalling that

$$f^2 \sim \textit{Gm}/\textit{R}^3$$

we obtain

$$h \sim \frac{G^2 m^2}{rRc^4} \sim \frac{R_s^2}{Rr}$$

Where R_s is Schwarzschild radius of the mass m

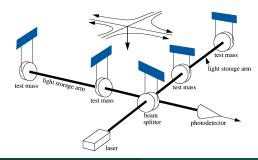

$$R_s = \frac{2Gm}{c^2}$$

Laser Interferometer Gravitational-wave Observatory

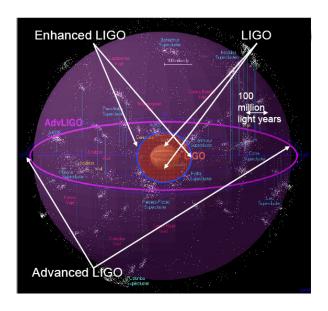

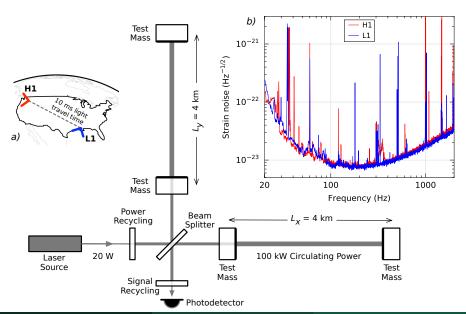

- *L* = 4 km
- $h \sim 10^{-23}$

Advanced LIGO sensitivity goal and noise budget

"Advanced LIGO", Class. Quantum Grav., 32, 074001 (2015)

Heisenberg uncertainty principle and its optics equivalent

Heisenberg uncertainty principle

 $\Delta p \Delta x \geq \hbar/2$

The more precisely the POSITION is determined, the less precisely the MOMENTUM is known, and vice versa

Heisenberg uncertainty principle and its optics equivalent

Heisenberg uncertainty principle

 $\Delta p \Delta x \geq \hbar/2$

The more precisely the POSITION is determined, the less precisely the MOMENTUM is known, and vice versa

Optics equivalent

 $\Delta \phi \Delta N > 1$

The more precisely the PHASE is determined, the less precisely the AMPLITUDE is known, and vice versa

Heisenberg uncertainty principle and its optics equivalent

Heisenberg uncertainty principle

 $\Delta p \Delta x \geq \hbar/2$

The more precisely the POSITION is determined, the less precisely the MOMENTUM is known, and vice versa

Optics equivalent

 $\Delta \phi \Delta N > 1$

The more precisely the PHASE is determined, the less precisely the AMPLITUDE is known, and vice versa

Optics equivalent strict definition

 $\Delta X_1 \Delta X_2 \geq 1/4$

Transition from classical to quantum field

Classical analog

- Field amplitude a
- Field real part $X_1 = (a^* + a)/2$
- Field imaginary part $X_2 = i(a^* a)/2$

$$E(\phi) = |a|e^{-i\phi} = X_1 + iX_2$$

 X_1

Quantum approach

- Field operator â
- Amplitude quadrature $\hat{X_1} = (\hat{a}^{\dagger} + \hat{a})/2$
- Phase quadrature $\hat{X}_2 = i(\hat{a}^{\dagger} \hat{a})/2$

$$\hat{E}(\phi) = \hat{X}_1 + i\hat{X}_2$$

Quantum optics summary

Light consist of photons

•
$$\hat{N} = a^{\dagger}a$$

Commutator relationship

•
$$[a, a^{\dagger}] = 1$$

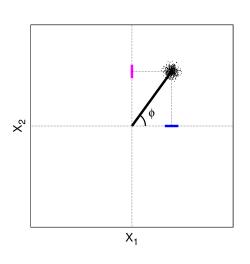

$$[X_1, X_2] = i/2$$

Detectors measure

- number of photons N̂
- Quadratures $\hat{X_1}$ and $\hat{X_2}$

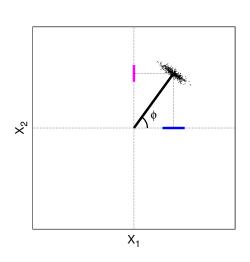

Uncertainty relationship

$$\Delta X_1 \Delta X_2 \ge 1/4$$

Summary

- In 2015 we detected the first Gravitational Wave
- Now we are talking about GW astronomy
